

Vaccination and Testing Policy

By the date of their arrival at camp, all summer camp participants, including staff, volunteers, and campers, shall be up to date with their COVID-19 vaccines, unless the participant has a documented medical or personal exemption. Read on for more details:

- *All summer camp staff and campers* must have a negative COVID-19 test result (test can be PCR, witnessed antigen, or a self-administered antigen test) and be able to provide proof of their test result. Tests must be administered 48 hours or less prior to arrival at camp. Without this test result, CazPAC will administer an antigen test upon arrival.
- *Vaccinated participants* must provide proof of up to date vaccination. A participant is up to date if they have received all recommended COVID-19 vaccines including any booster dose(s) when eligible. <https://www.cdc.gov/coronavirus/2019-ncov/vaccines/stay-up-to-date.html>
- *Participants who are unvaccinated or are not up to date* with their COVID-19 vaccinations will need to provide documentation of medical exemption or a signed statement explaining their personal exemption. Additionally, these participants shall be required to limit interactions with larger groups for 10 days prior to their arrival at camp and during any time spent offsite (ie. staff's days off), especially indoors, and especially if anyone in those larger groups may be unvaccinated. Finally, these participants will be required to test once-per-week while at camp.

Screening testing will be done once weekly three days after arrival at camp and weekly thereafter. Participants who are up to date with their vaccinations are not required to participate in routine screening testing, but testing may be required in the case of individuals showing symptoms or in close contact with COVID-19 cases.

Rental and weekend programs will work in advance with the Executive Director to arrange a similarly strong vaccination and testing policy, according to the needs of their particular school district and program.

Due to the highly transmissible nature of Covid-19, and because many individuals may develop side effects after receiving a vaccine (including but not limited to fever, cough, body aches, nausea, headache, etc.), if a camper or staff member has any symptoms after recently receiving a vaccine, they will be required to stay home until the criteria to return to camp are met. Side effects after vaccination generally last 1-3 days. We recommend NOT receiving a dose of vaccine in the 7 days prior to arriving to camp.
